

QA evidence — v1.0.17 mouse-copy + double-prompt fixes (2026-05-29)

Revision: 1 **Last modified:** 2026-05-29T11:30:00Z

Captured runtime evidence (§11.4.83) for the two user-reported bug fixes and the B3 closure. Source mandate (operator, 2026-05-29): mouse select/copy unusable in tmx panes especially under Claude Code; double session-name prompt on new bash-login terminals.

Artefact	Proves
metatest_45caught_0escaped.log	Paired-mutation harness: 45 CAUGHT / 0 ESCAPED. M-DBLPROMPT (double-prompt guard) CAUGHT; M-MOUSETOGGLE validated (SKIP on dirty template pre-commit; runs clean post-commit). P5-M20/M21/M22 all CAUGHT (B3 closed).
full_suite_51pass_0fail.log	run_all.sh (correct TMUX_BIN): PASS=51 FAIL=0 SKIP=4. Tests 49/50 PASS; test 54 (double-prompt) PASS; test 55 (mouse toggle) PASS; test 56 (real-mouse) honest §11.4.3 SKIP.
iterm2_single_prompt_capture.txt	Real iTerm2 capture: blank Enter → bare shell, exactly ONE prompt (post-fix single-source behaviour preserved).

Reproduction facts (no guessing, §11.4.6):

- Double-prompt: nezha bash -l -i → PROMPT_COUNT=2 (pre-fix), 1 (post-fix). macOS zsh → 1 always.
- Mouse: live Herald server had mouse on + M-/S- overrides + working @clip→pbcopy; defect was discoverability (tracking-app plain-drag forwarded; iTerm2 Option Key Sends=Normal eats Alt-drag).

Tests: scripts/tests/54_double_prompt_idempotent.sh, 55_mouse_toggle_and_copy.sh, 56_real_mouse_drag_copy.sh. Mutations: M-DBLPROMPT, M-MOUSETOGGLE in scripts/tests/meta_test_false_positive_proof.sh.
