

vasic-digital tmux — v1.0.25 Release Notes

Revision: 1 **Last modified:** 2026-06-16T19:00:00Z **Version:** 1.0.25 / versionCode 26 **Released:** 2026-06-16 **Hosts validated:** Mistborn (Darwin arm64) + nezha (ALT Linux x86_64)

Summary

v1.0.25 is a **governance + tooling currency** release (no tmux product-surface change) per the operator mandate "we MUST ALWAYS target the latest versions of all our submodules": the HelixConstitution submodule is advanced to its latest upstream, host-level codegraph version skew is fixed, and dead test-socket cruft is cleaned.

Changed

- **HelixConstitution submodule 3f4d690 → 1d408cb** (+67 commits, new anchors §11.4.140–158). Functional inheritance verified: `18_constitution_inheritance.sh PASS=10/0`. Release gate unaffected (verify.sh enforces §11.4.87..99, already mirrored).
- **Containers submodule** confirmed at latest 18ed03d.

Fixed

- **Test 17 (scrollback / copy-mode) load flake — root-caused + fixed, 2 vectors (§11.4.1/§11.4.6/§11.4.50)**. Flaked under heavy host load (FAIL-bluffs, not a product defect). (1) The T4 generator spelled the literal `SCROLLMARK_FIRST/SCROLLMARK_LAST` inline, so the terminal's echo of the typed command line contained `SCROLLMARK_LAST` and the `GEN_OK` poll matched the command echo before any real output; fix assembles the markers from a shell variable (`M=SCROLLMARK; echo ${M}_LAST`) so every grep matches REAL OUTPUT only. (2) Under all-core CPU saturation a capture-pane grid dump can momentarily lack the oldest `FIRST` marker although the buffer genuinely retains all 3000 lines; fix asserts retention via the race-free `#{history_size}` counter (`>= 2900`; the no-eviction value is a deterministic ~2982, the OLD 2000 cap pins it at 2000 and evicts line 1), not a grid dump (T4.3/T4.4 operator copy-mode reach already proved retention robustly). Test source only (`scripts/tests/17_scrollback_copy_mode.sh`). Determinism (§11.4.50) PROVEN: macOS N=5 GREEN (5/5) + nezha N=20 under full all-core CPU saturation

GREEN (20/20); history_size identical every run (macOS 2981 / nezha 2982 — counter does not race).

- **Tests 12 & 14 (destructive cgroup OOM) — swap-aware OOM (§11.4.81/ §11.4.50).** Failed deterministically on nezha after the host gained 15 GiB swap (the cgroup enforced MemoryMax via swap, oom_kill=0). Fix: set memory.swap.max=0 on the test scope so exceeding the cap OOM-kills deterministically (verified oom_kill 0 → 295). Now PASS 3/3 each.
- **codegraph macOS skew** (host-level) — stale ~/.local/bin/codegraph symlink (→ v0.9.9) shadowed the npm-managed 1.0.1; repointed → both hosts resolve **1.0.1**.
- **macOS host hygiene** — removed **668 dead tmux test sockets** (678 → 10), no live session touched.

Validation (dual-host release gate)

Host	gate	meta
Mistborn (Darwin arm64)	run_all GREEN	—
nezha (ALT Linux x86_64)	verify.sh GREEN (destructive)	52 CAUGHT / 0 ESCAPED

setup.sh re-run + verified GREEN on both hosts; both reinstalled at v1.0.25.

Known follow-up (non-release-blocking)

- Verbatim/cascade mirroring of §11.4.140–158 into CLAUDE.md/AGENTS.md/ QWEN.md for non-@import agents (functional inheritance already works via the import; release gate does not enforce these).
- Operator-pending on nezha: sudo bash scripts/build_oom_set.sh -- install + sudo apt-get install -y stress-ng → promotes tests 08/12/14 from honest SKIP to PASS.

Files changed

- Containers/constitution submodule pointers; VERSION (1.0.25/26); CHANGELOG.md; CONTINUATION.md.
