

vasic-digital tmux — v1.0.24 Release Notes

Revision: 1 **Last modified:** 2026-06-16T18:00:00Z **Version:** 1.0.24 / versionCode 25 **Released:** 2026-06-16 **Hosts validated:** Mistborn (Darwin arm64) + nezha (ALT Linux x86_64)

Summary

v1.0.24 adds an **on-demand container-distribution orchestrator** — `scripts/tmx-orchestrator/`, a real Go binary that drives the `vasic-digital/containers` submodule to schedule, deploy, health-check, and tear down containers on remote test hosts (`nezha.local`), for heavy testing that depends on real services running. The tmux product surface (the hardened tmux 3.6a binary + `tmx` wrapper) is **unchanged** from v1.0.23; this release is testing tooling plus extensions and hardening of the consumed Containers library.

Added

- **`scripts/tmx-orchestrator/`** — Go consumer of the decoupled `digital.vasic.containers` submodule (via `replace`, `CONST-051`).
Subcommands:
 - `hosts` — register + SSH-probe configured remote hosts (real /proc resources).
 - `distribute` — schedule + `podman run -d -p host:container` a real container on the best remote host + poll-until-ready health check (HTTP/TCP).
 - `down` — teardown; **exits non-zero when teardown cannot be confirmed**.
- **`scripts/tests/62_distribution_orchestrator.sh`** — opt-in (`TMX_TEST_REMOTE=1`) end-to-end test (build → probe → deploy real nginx + HTTP 200 → teardown). SKIP with reason by default; auto-included in `run_all.sh`.

Fixed (Containers library — extended/hardened upstream per §11.4.76)

- Remote deploy port publishing (`ContainerRequirements.Ports + -p`) — 1b9da9b.
- Command-injection in port-publish protocol → allowlisted — 82bd586.

- ControlMaster socket leak in SSHExecutor. Execute (released ref only on success) → release on all paths + RED→GREEN regression test on nezha — a856865; same-class ExecuteStream early-error leak — 18ed03d.
- tmx-orchestrator down FAIL-bluff (reported success on an unreachable host).

Tests — release gate (real captured)

- nezha verify.sh (TMX_TEST_DESTRUCTIVE=1): **PASS=50 FAIL=0 SKIP=11, GREEN.**
- nezha meta-test paired-mutation sweep: **52 CAUGHT / 0 ESCAPED.**
- nezha Containers full suite (unit + -tags=integration vs real podman): all 40 packages ok.
- macOS run_all: **PASS=55 FAIL=0 SKIP=6** (zero regression).
- test 62 (TMX_TEST_REMOTE=1): PASS=4/0.
- **Adversarial code-review** (§11.4.125/§11.4.134): 2 major + 4 minor → all fixed → re-review **GO.**

Validation (dual-host)

Host	release gate	meta	orchestrator e2e
Mistborn (Darwin arm64)	run_all PASS=55/0/6	(Linux host)	conductor — distribute → HTTP 200 on nezha
nezha (ALT Linux x86_64)	verify.sh EXIT 0 PASS=50/0/11	52 CAUGHT / 0 ESCAPED	target — real nginx published + health-checked

Files changed

- scripts/tmx-orchestrator/ (new module), scripts/tests/62_distribution_orchestrator.sh (new).
- Containers submodule pointer 61e01dc → 18ed03d (3 fix commits, github + gitlab).
- VERSION (1.0.24 / versionCode 25), CHANGELOG.md, Fixed.md (A48), CONTINUATION.md.
- Evidence: docs/qa/2026-06-16-tmx-orchestrator/.
