Termux Port Feasibility Research — Index

Revision: 1 **Last modified:** 2026-05-22T07:20:02Z **Authority:** vasic-digital tmux project (research-only deliverable, no code changes) **Maintainer:** milosvasic **Scope:** Investigate the feasibility of porting the vasic-digital hardened tmux build + tmx wrapper + v1.0.9 shell-init / Go state daemon / SSH dispatch features to **Android via Termux**. No implementation work is performed here — this is a future-port planning artefact.

Why this exists

Today the project supports Linux (cgroup-v2 transient scopes via `systemd-run --user --scope`) and macOS (POSIX `setrlimit` wrapper). Mobile shells via Termux are a recurring operator ask; before we commit engineering effort, §11.4.6 (no-guessing) demands deep web research with cited evidence rather than gut-feel estimation.

Per §11.4.81 (cross-platform-parity) any new platform becomes a first-class citizen with its own honest-gap citation table — this research lays the groundwork.

Files

# File	Topic	Approx. lines
1 01_environment_overview.md	What Termux is + Android userland constraints	150
2 02_build_toolchain.md	How to produce native binaries (in-Termux build vs NDK cross-compile vs termux-packages)	200
3 03_runtime_isolation.md	The key question — what replaces <code>systemd-run --user --scope</code> ? (rlimit + honest gap citation)	250
4 04_ssh_in_termux.md	Termux's OpenSSH on port 8022 — <code>command= directive + tmx-ssh-dispatch</code> portability	150
5 05_user_experience.md	Touch keyboard, wake-lock, F-Droid install, end-user setup	150
6 06_constraints_and_gaps.md	Honest enumeration of WILL-NOT-WORK and WILL-DEGRADE features	150
7 07_test_strategy.md	Anti-bluff testing on Android + §11.4.81 four-platform parity table	150
8 08_recommendation.md	Synthesis: yes / no / conditional + effort estimate	100

Read them in order — each builds on the previous one. §06 + §08 are the operator-actionable summaries.

Citations

Every non-obvious claim carries a URL. Where verification was incomplete the claim is marked UNCONFIRMED: per §11.4.6 (no-guessing mandate).

Exports

Per §11.4.65, each .md file has .html + .pdf siblings produced by `scripts/export_docs.sh`. If you do not see them next to a file, the export pipeline has not yet been run since that file's last modification — re-run `bash scripts/export_docs.sh` to refresh.
